PRE · INTRA · POST WORKOUT OPTIMIZATION COMPLETE SUPPLEMENT GUIDE

Every Ingredient Analyzed · DIY Formulas · Intra-Workout Fuel · Recovery Stack

Stop wasting money on proprietary blends — understand what actually works

ELITE FITNESS GUIDE SERIES

Research-Based · Professional Edition · 2024

■ TABLE OF CONTENTS

1. Pre-Workout Science — What Actually Works
2. The Stimulant Layer — Caffeine, Dynamine, TeaCrine
3. The Pump Layer — L-Citrulline, Arginine, Norvaline
4. The Performance Layer — Beta-Alanine, Creatine, Betaine
5. The Focus Layer — Alpha-GPC, Tyrosine, Huperzine A
6. DIY Pre-Workout Formula Guide
7. Intra-Workout Nutrition — What to Consume During Training
8. Post-Workout — Protein Synthesis Window (Myth vs Reality)
9. The Anabolic Window — Timing & Protocol
10. Post-Workout Supplement Stack
11. Pre-Workout Timing & Tolerance Management
12. What to Avoid — Useless Ingredients

1. PRE-WORKOUT SCIENCE

The pre-workout supplement market is a \$5,000 crore industry globally, yet most products contain proprietary blends with clinically ineffective doses behind exotic names. This guide cuts through the marketing to show you **exactly which ingredients work, at what doses, and why.**

A 2021 systematic review (Martinez et al., Journal of the International Society of Sports Nutrition) analyzed 44 commercially available pre-workout products. Finding: 75% were under-dosed for key active ingredients relative to clinically validated doses. The average product contained ingredients at 40% of the evidence-based dose.

Evidence Level	Ingredients	Benefit
Grade A (Very Strong)	Caffeine, Creatine, Citrulline, Beta-Alanine	Primary drivers of pre-workout performance
Grade B (Good)	Betaine, Alpha-GPC, Tyrosine, Theanine	Meaningful secondary contributors
Grade C (Moderate)	Beet Root Extract, Norvaline, Taurine	Modest benefits; worth including at correct dose
Grade D (Weak/Inconclusive)	BCAAs pre-workout, Glutamine, Vitamin B12	Limited evidence for acute pre-workout benefit
Grade F (No Evidence)	Proprietary blends', fairy-dusted exotics, most herbals at under-studied doses	Marketing only

2. THE STIMULANT LAYER

Caffeine Anhydrous — The Gold Standard Stimulant:

Caffeine is the most researched ergogenic aid in sports nutrition history. It works via adenosine receptor antagonism — blocking the sleep-inducing signal in your brain. This increases adrenaline, dopamine, and acetylcholine simultaneously.

- **Optimal dose:** 3–6 mg/kg body weight. 70kg athlete: 210–420 mg
- **Timing:** 30–45 min before training (peak plasma: 45–60 min)
- **Tolerance management:** Cycle caffeine — take 2 days off per week to prevent receptor downregulation
- **Benefits:** 10–15% increase in strength output; significant endurance improvement; pain perception reduction; improved focus and motivation
- **Caution:** Half-life 5–6 hours; avoid after 2 PM if bedtime is 10 PM

Dynamine (Methylliberine) + TeaCrine (Theacrine):

- Dynamine: Faster onset than caffeine (15 min); dopaminergic; pairs well with caffeine
- TeaCrine: Same mechanism as caffeine but zero tolerance development over time
- Effective stack: Caffeine 200mg + Dynamine 100mg + TeaCrine 50mg — fast onset + sustained effect

3–4. THE PUMP & PERFORMANCE LAYERS

Ingredient	Clinical Dose	Mechanism	Effect
L-Citrulline	6–10 g (not citrulline malate)	Converted to arginine in kidneys → nitric oxide (NO) production	Best pump ingredient, superior to arginine due to better oral bioavailability
Agmatine Sulfate	500 mg–1 g	NOS inhibitor → amplifies NO signaling; also reduces pain perception	Synergistic with citrulline; unique pain-reducing benefit
Norvaline	100–200 mg	Arginase enzyme inhibitor — prevents breakdown of arginine into urea; prolongs NO effect	Added benefit; dose-dependent benefit
HydroMax Glycerol	Hyperhydrates muscle cells; draws water into muscle → skin-splitting effect	Fluid retention	Explosive strength and performance in hot conditions

Ingredient	Clinical Dose	Mechanism	Expected Benefit
Beta-Alanine	3–6 g	Combines with histidine → carnosine in muscle	3% endurance increase (and less fatigue). Causes tingles (paraesthesia)
Creatine Monohydrate	5 g (maintenance) or 20 g (loading)	Increases phosphocreatine stores → faster ATP regeneration	1–2% strength increase per 4 weeks; one of the most proven
Betaine Anhydrous	2–5 g	Osmolyte — improves cellular hydration similar to creatine; may increase GH	Strength increase; 1.3 kg lean mass in some

5–6. FOCUS LAYER & DIY FORMULA

Ingredient	Dose	Mechanism	Best For
Alpha-GPC	300–500 mg	Choline precursor — enhances mind-muscle connection; increases GH output	Mind-muscle connection; neurological focus
L-Tyrosine	500–2000 mg	Adrenaline precursor; maintains cognitive performance under stress	Endurance; stress training; stimulant augmentation

Ingredient	Dose	Mechanism	Best For
L-Theanine	100–200 mg (with Caffeine)	Adenosine receptor modulation; reduces caffeine jitteriness; improves calm focus	Pre-workout with caffeine 2:1 ratio; reduces anxiety without reducing stimulation
Huperzine A	50–200 mcg	Acetylcholinesterase inhibitor — prevents breakdown of acetylcholine, signaling for muscle force	Overcoming fatigue (every 2–3 days) — accumulates; avoid daily

DIY Pre-Workout Formula (per serving):

Ingredient	Amount	Cost/Serving
Caffeine Anhydrous	200 mg	■0.50
L-Citrulline	6000 mg	■8–12
Beta-Alanine	3200 mg	■4–6
Creatine Monohydrate	5000 mg	■3–5
Alpha-GPC 50%	300 mg	■6–10
L-Theanine	200 mg	■2–4
Betaine Anhydrous	2500 mg	■5–8
Agmatine Sulfate	500 mg	■3–5
TOTAL	~17.7g powder	■30–50 (vs ■200–500 for commercial)

■ 7–8. INTRA-WORKOUT & POST-WORKOUT

Intra-Workout Nutrition (for sessions >60 minutes):

Component	Amount	Source	Purpose
Fast Carbohydrates	20–40 g per hour	Dextrose, Cyclic Dextrin, bamboo maltodextrin	Maintains muscle glycogen; prevents cortisol spike; sustains performance in 2nd hour
Essential Amino Acids (EAAs)	6–10 g	EAA supplement or 20g whey (small portion)	Prevents muscle protein breakdown; stimulates synthesis during training
Electrolytes	Full spectrum	Sports drink / electrolyte powder / salt tablets	Prevents hyponatremia; maintains muscle contraction; crucial in Indian heat
Water	500–800 mL per hour	Plain water	Prevents dehydration-induced strength loss (2% dehydration = 10% strength loss)

The Anabolic Window — Myth vs Reality:

■ Aragon & Schoenfeld (2013, JISSN) meta-analysis: the 'anabolic window' of 30–45 minutes post-workout is largely a myth for athletes who consumed a pre-workout meal. Muscle protein synthesis is elevated for 24–48 hours post-training — total daily protein intake matters far more than timing.

- If fasted before training: Post-workout meal is critical — consume protein + carbs within 30 min
- If fed before training: Post-workout meal within 2–3 hours is sufficient
- Always prioritize: Total daily protein (1.5–2g/lb) over meal timing

Post-Workout Supplement Stack:

Supplement	Dose	Timing	Evidence
Whey Protein Isolate	25–40 g	Within 1 hr post-workout	Strong — fastest digesting complete protein; leucine content drives MPS
Creatine Monohydrate	5 g	Post-workout (slightly better than pre)	Strong — marginally superior post-workout absorption in one meta-analysis
Fast Carbohydrates	40–80 g	Post-workout with protein	Strong — restores glycogen; insulin spike aids creatine uptake
Tart Cherry Extract	480 mg	Post-workout	Moderate — reduces muscle soreness and inflammation significantly

Knowledge of ingredient mechanisms eliminates expensive marketing decisions. Build your stack on science, not branding.
